Assessing the Impacts of Transaction Costs and Rapid Growth on Local Government Service Provision and Delivery Arrangement Choices in North Dakota

Andy Huilquist*, Dana Michael Harsell†, Robert S. Wood* & David T. Flynn**
*Department of Political Science **Department of Economics / University of North Dakota

Introduction

• Service provision as a core function of local governments
  - Entails not only the question of whether to provide services, but also how to provide them – the ‘may or buy’ decision
• Contracting out for service provision remains a popular option for local governments
  - Motivated by considerations of efficiency, economies of scale, other cost savings, increased private sector innovation
  - However, contracting may not work in all environments and for all services (e.g. solar, 2000) or may sacrifice essential public character of those services (Milward & Provan, 2000)
• Substantial literature exists describing the factors that lead governments to contract out, and what motivates their choice among service delivery modes (different types of vendors) when they do

Methods

• Multinomial Logit with Clustered Standard Errors
  - Expresses probability of providing a service through a given mode relative to a base mode of provision (internal production)
• Dependent Variable: Mode of Service Delivery
  - Four Possible Modes of Service Delivery:
    - Metropolitan/Micropolitan Area
    - Population Growth (+) Service Measurability
    - Asset Specificity
• Measures of Local Growth
  - Population Growth (percent, 2009-13)
  - Per Capita Income (2013, $thousand)
• Service Characteristics
  - Asset Specificity
  - Service Measurability

Standard Errors in Parentheses

Findings

• Significant factors influencing probability of contracting with other governments (relative to internal production)
  - Asset specificity (+)
  - Asset Specificity (+)
  - Per Capita Income (+)
  - Per Capita Income (-)
• Significant factors influencing probability of contracting with private providers (relative to in-house production)
  - Service measurability (-)
  - Service Specificity (-)
  - Population (-)
  - Population/Urban interaction (+)
  - Population Growth (+)
  - Percent Oil/Gas Employment (-)
• Significant factors influencing probability of joint contracting (relative to internal production)
  - Asset specificity (+)
  - Asset Specificity (-)
  - Service Measurability (-)
  - Urban area (-)

Conclusions

• When choosing whether to contract/who to contract with, North Dakota governments behave similarly to other, larger governments in some respects
• Service characteristics, associated transaction costs have a significant effect
• Differences in findings when compared to other research make sense when considering size, rurality of North Dakota communities
• Lack of consistent response to market factors may reflect the fact that NO North Dakota market is large enough to be considered well functioning, competitive with respect to public service vendors
• Findings suggest size, capacity, rurality of North Dakota governments may prevent contracting out, contracting to certain types of vendors is an unrealistic or unavailable option under some conditions
• Few efforts associated with growth, but may reflect communities taking advantage of available resources, or even their attitudes and expectations towards the permanence of the oil boom, future levels of demand
